

What are some REST best practices not covered in this week's videos? List at least 3 and describe why they are important.

Collection endpoints should use plural nouns, this helps remind and inform users the endpoint could/should have multiple entries.

Use standard HTTP error codes for handling response/requests. This makes it easier to troubleshoot issues and narrow down resolutions.

Be clear with the naming convention on endpoints when it comes to versions, this way an individual can identify the version they need for the endpoint they need to access.

What are some other features the REST entails that we didn't cover this week?

There are multiple methods which were not covered, HEAD, PATCH, OPTIONS, and TRACE. There are also HEADERS, NAVIGATION, EVENTING, Error codes, even Authentications features.
